Uygulamanın Tanıtımı

Oto sanayi dükkanının giriş çıkışlarını kontrol eden bir uygulama tasarladım. Uygulamada tamire giren bir aracın kaç gün kaldığından, tamir ücretine; personel maaşlarından stokta kaç ürün kaldığına kadar birçok işlemin uygulama sayesinde kolayca hesaplanmasını, eklenip, çıkartılmasını yani kontrol edilmesini sağladım. Bunu yaparken ise postgresql veri tabanını kullandım.

İş Kuralları

- İş yeri birden fazla dükkândan oluşur.
- Dükkânın adı, adresi, telefonu ve patronun kim olduğu bilgileri bulunur.
- Dükkân faturalar oluşturur. Faturaların tutarı, tarihi, tipi ve hangi mağazaya ait olduğu tutulur.
- Dükkânın gelir ve giderleri tutulur. Gelir ve giderlerin tutar bilgisi ve tarih bilgisi vardır.
- Faturaların ne faturası olduğu bilgisi ayrı tutulur.
- İnsanların T.C. No, isim, soy isim, telefon, adres bilgileri bulunur.
- Kişiler ya personel ya müşteri ya da tedarikçidir. Bunlar haricinde bir kişi bulunmamaktadır.
- Müşterinin vergi adresi tutulur.
- Personellere dükkân tarafından ücret ödenir.
- Ücret; maas, SSK, yol, yemek ve toplam ücretten oluşur.
- Dükkân ürün sipariş eder.
- Bir siparişte en az bir ürün olmak zorundadır ancak birden fazla üründe olabilir. Bir ürün birden fazla siparişte bulunabilir ya da hiçbir siparişte bulunmayabilir.
- Siparişlerdeki ürünlerin kaç adet olduğu ve birim fiyatları da saklanmalıdır.
- Ürünlerin ürün kodu, ürün ismi, ürün modeli ve üründen kaç tane kaldığı bilgileri tutulur.
- Müşterilere ürün satılabilir. Satışların dükkândan satıldığı bilgisi tutulur.
- Bir satışta birden fazla ürün bulunabilir. Bu satıştaki ürünleri adedi ve birim fiyatı tutulur.
- Müşterilerin araçları bulunur. Bu araçların plaka, model, km, bilgileri tutulur.
- Araclar personeller tarafından tamir edilirler.
- Tamir hakkında aracın tamirine başlanma tarihi, aracın tamirinin sona erdiği tarih, tamirin ücreti ve tamirde ne yapıldığı tutulur.
- Bir araç birçok defa tamir edilebilir veya hiç tamir edilmez. Bir tamir yalnızca bir araca yapılır.
- Bir personel birden fazla aracı tamir edebilir veya hiçbir aracı tamir etmeyebilir. Bir tamir en az bir personel tarafından yapılmak zorundadır fakat birden fazla personel tarafından da yapılabilir.
- Bir müşteri birden fazla araca sahip olabilir veya hiçbir araca sahip olmayabilir. Bir araç yalnızca bir müşteriye aittir.
- Bir müşteriye birden fazla satış yapılabilir veya hiçbir satış yapılmaz. Bir satış yalnızca bir müşteriye yapılır.

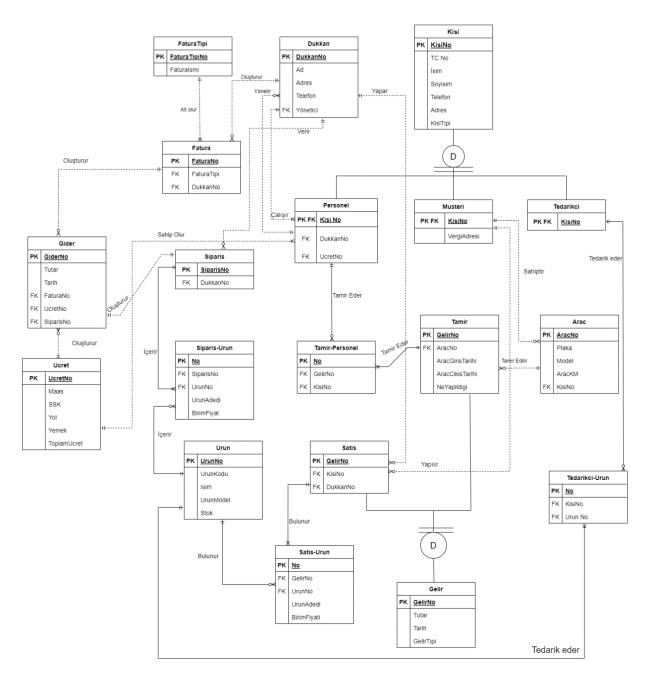

- Bir dükkân birden fazla satış yapabilir veya hiçbir satış yapamaz. Bir satış yalnızca bir dükkândan yapılır.
- Bir satışta en az bir ürün bulunmak zorundadır ancak birden fazla üründe bulunabilir. Bir ürün birden fazla satışta bulunabilir veya hiçbir satışta bulunmayabilir.
- Bir ürün birden fazla tedarikçi tarafından tedarik edilebilir veya sadece bir tedarikçiden tedarik edilir. Bir tedarikçi birden fazla ürün tedarik edebilir veya hiçbir ürün tedarik etmeyebilir.
- Bir dükkân birden fazla sipariş verebilir veya hiçbir sipariş vermez. Bir sipariş yalnızca bir dükkândan verilebilir.
- Bir dükkânın en az bir personeli vardır. Bir personel yalnızca bir dükkânda çalışır.
- Bir dükkân yalnızca bir personel tarafından yönetilir. Bir personel birden fazla dükkânı yönetebilir veya hiçbir dükkânı yönetmez.
- Bir ücret en az bir personele aittir. Bir personelin yalnızca bir ücreti vardır.
- Bir dükkân birden fazla fatura oluşturabilir veya hiçbir fatura oluşturmaz. Bir fatura yalnızca bir dükkân tarafından oluşturulur.
- Bir fatura yalnızca bir fatura tipine ait olabilir. Bir fatura tipi birden fazla faturaya ait olabilir.
- Bir fatura birden fazla gider oluşturabilir veya hiç oluşturmaz. Bir gider yalnızca bir fatura tarafından oluşturulur.
- Bir sipariş yalnızca bir gider oluşturur. Bir gider yalnızca bir sipariş tarafından oluşturulur.
- Bir ücret birden fazla gider oluşturabilir veya hiç oluşturmaz. Bir gider yalnızca bir ücret tarafından oluşturulabilir.
- Gelirler ya satış ya da tamirdir. Bunlar haricinde bir gelir bulunmamaktadır.

Fonksiyonlar ne yapıyor

• get_data_kisi(kişino integer) fonksiyonu girilen kisino parametresine göre kişinin ad ve soyadını birleştirip bir text halinde kullanıcıya geri döndürüyor.

```
CREATE OR REPLACE FUNCTION public.get_data_kisi(kisino integer)
RETURNS character varying
LANGUAGE plpgsql
AS $function$

declare

isim varchar(50);
soyisim varchar(50);
ad varchar(110);

begin

isim:=(select "Isim" from "Kisi" where "KisiNo"=kisino);
soyisim:=(select "Soyisim" from "Kisi" where "KisiNo"=kisino);
ad:=isim|| "||soyisim;
return ad;
end;
$function$
```

 karzararhesapla(sayi integer) fonksiyonu geriye bir tablo döndürüyor öyleki bu tablo girilen sayi değerine göre günümüzden girilen değer kadar öncesinin 1 aylık gelir ve giderlerini hesaplıyor. Sonra gelirleri giderlerden çıkararak kar-zarar hesaplıyor. Tarihleri ile birlikte bunu ekrana yazıyor.

```
CREATE OR REPLACE FUNCTION public.karzararhesapla(sayi integer)
RETURNS TABLE("GelirTutar" double precision, "GiderTutar" double precision, "Kar-Zarar" double precision, "Tarih1" date,
"Tarih2" date)
LANGUAGE plpgsql
AS $function$
declare
begin
          if (select sum("Tutar")as toplamgelir from "Gelir" where age("Gelir"."Tarih")BETWEEN INTERVAL '1
          month'*(sayi-1) and interval '1month'*sayi) is NULL then
          return query
          select "toplamgelir", "toplamgider",0-"toplamgider" as "karzarar",date(current_date-interval '1month'*(sayi)) as
          "Baslangic",date(current_date-interval '1month'*(sayi-1)) as "Bitis" from (select sum("Tutar")as toplamgelir from
          "Gelir" where age("Gelir"."Tarih")BETWEEN INTERVAL '1 month'*(sayi-1) -interval'1day' and interval
          '1month'*sayi) as gelir, (select sum("Tutar") as toplamgider from "Gider" where age("Gider". "Tarih")BETWEEN
          INTERVAL '1 month'*(sayi-1)-interval'1day' and interval '1month'*sayi) as gider;
          elseif (select sum("Tutar") as toplamgider from "Gider" where age("Gider"."Tarih")BETWEEN INTERVAL '1
          month'*(sayi-1) and interval '1 month'*sayi) is null then
          return query
```

```

```

 karzarartablo(sayac integer) fonksiyonu günümüzden girilen sayaç kadar öncesinin kar-zarar tablosunu 1 aylık aralıklarla gösteriyor. Bunu yaparken karzararhesapla(sayi integer) fonksiyonunu kullanıyor. İçinde bir döngü ile sayaç kadar karzararhesapla fonksiyonundan dönen değerleri bir tabloya döküyor.

```
Create Type my_type6 as(("GelirTutar" double precision, "GiderTutar" double precision, "Kar-Zarar" double precision, "Baslangic" date, "Bitis" date)

CREATE OR REPLACE FUNCTION public.karzarartablo(sayac integer)

RETURNS SETOF my_type6

LANGUAGE plpgsql

AS $function$

declare

begin

for i in 1 .. sayac loop

return next karzararhesapla(i);
end loop;
end $function$
```

• stoktavarmi(urunno int, urunadet int) fonksiyonu girilen urunno'dan istenilen urunadet kadar var mı diye kontrol ediyor. Ürünün stok sayısı istenilen değerden büyük ise geriye true bir boolean değer döndürüyor. Değil ise geriye false döndürüyor.

```
CREATE OR REPLACE FUNCTION public.stoktavarmi(urunno integer, urunadet integer)
RETURNS boolean
LANGUAGE plpgsql
AS $function$
declare
          varmi boolean:
          stok integer;
begin
          stok:=(select "Stok" from "Urun" where "UrunNo"=urunno);
          if stok>urunadet then
          return true;
          else
          return false:
          end if;
end;
$function$
```

• "TrigFuncSatis-Urun_GelirGuncelle"() fonksiyonu bir trigger fonksiyondur. Satis-Urun tablosuna bir kayıt eklendikten sonra Gelir tablosundaki Tutarı güncelliyor. İlk önce ürünün birim fiyatı ile ürün adedini çarparak tutar hesaplıyor. Ondan sonra bu tutarı Gelirdeki ilişkili Tutara ekliyor.

```
CREATE OR REPLACE FUNCTION public. "TrigFuncSatis-Urun_GelirGuncelle"()
RETURNS trigger
LANGUAGE plpgsql
AS $function$
Declare
          fiyat double precision;
          tutar int;
Begin
          tutar:=(select "Tutar" from "Gelir"
          where "GelirNo"=new."GelirNo");
          if tutar is null then
          fiyat:= ((new."UrunAdedi") * (new."BirimFiyat"));
          else
          fiyat:= tutar+((new."UrunAdedi") * (new."BirimFiyat"));
          Update "Gelir" set "Tutar"=fiyat where "GelirNo"=new. "GelirNo";
          return new;
End;
$function$
```

• "TrigFuncSatisStokDüsme"() fonksiyonu bir trigger fonksiyondur. Satis-Urun tablosuna bir kayıt eklendikten sonra satılan ürün adedince ürünün stoğunu düşürüyor.

```
CREATE OR REPLACE FUNCTION public."TrigFuncSatisStokDüsme"()
RETURNS trigger
LANGUAGE plpgsql
AS $function$
declare
stok int;
begin
stok:=(select "Stok" from "Urun" where "UrunNo"=new."UrunNo");
update "Urun" set "Stok"=stok-new."UrunAdedi" where "UrunNo"=new."UrunNo";
return new;
end;
$function$
```

• "TrigFuncSiparis-Urun_GiderGuncelle"() fonksiyonu bir trigger fonksiyondur. Siparis-Urun tablosuna bir kayıt eklendikten sonra Gider tablosunu güncelliyor. Bu şu şekilde yapılıyor ürünün birim fiyatı ile ürün adedini çarpıyor çıkan tutarı Gider tablosundaki ilişkili tutara ekliyor.

```
CREATE OR REPLACE FUNCTION public. "TrigFuncSiparis-Urun_GiderGuncelle"()
RETURNS trigger
LANGUAGE plpgsql
AS $function$
Declare
          fiyat double precision;
          tutar int:
Begin
          tutar:=(select "Tutar" from "Gider"
          where "Gider". "SiparisNo"=new. "SiparisNo");
          if tutar is null then
          fiyat:= ((new."UrunAdedi") * (new."BirimFiyat"));
          fivat:= tutar+((new."UrunAdedi") * (new."BirimFiyat"));
          end if;Update "Gider" set "Tutar"=fiyat where "SiparisNo"=new."SiparisNo";
End;
$function$
```

• "TrigFuncSiparisStokEkleme"() fonksiyonu bir trigger fonksiyondur. Siparis-Urun tablosuna kayıt girildikten sonra girilen kayıttaki ürün adedince ürün tablosundaki ilişkili ürünün stoğunu arttırıyor.

```
RETURNS trigger
LANGUAGE plpgsql
AS $function$
Declare
stok int;
Begin
stok:=(select "Stok" from "Urun" where "UrunNo"=new."UrunNo");
update "Urun" set "Stok"=stok+new."UrunAdedi" where "UrunNo"=new."UrunNo";
return New;
End;
$function$
```

• "TrigFuncUcretToplamHesapla"() fonksiyonu bir trigger fonksiyondur. Ucret tablosunda tutulan personellerin dükkana olan giderlerinin toplamını hesaplamaya yarıyor. Ucret tablosuna bir kayıt girildikten sonra girilen maas, yol, yemek, SSK giderlerini topluyor ve ilişkili ToplamUcreti güncelliyor.

```
CREATE OR REPLACE FUNCTION public."TrigFuncUcretToplamHesapla"()
RETURNS trigger
LANGUAGE plpgsql
AS $function$
declare
toplam int;
Begin

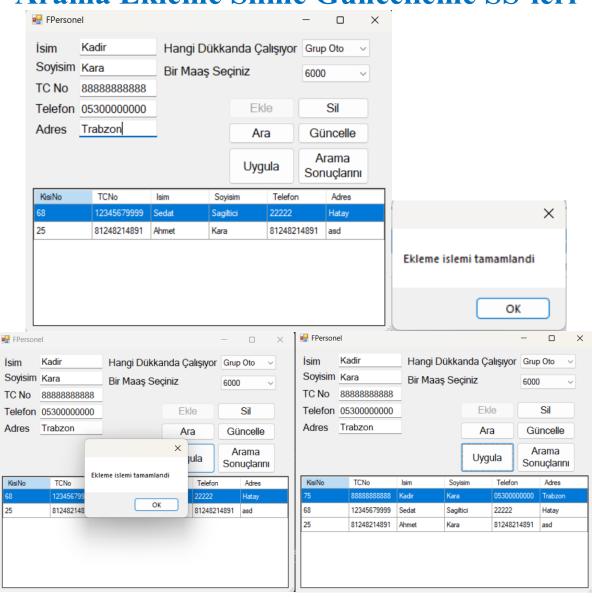

if new."Maas" oold."Maas" or new."Yol" oold."Yol" or new."Yemek" oold."Yemek" or new."SSK" oold."SSK" or
new."ToplamUcret" is NULL then
toplam:=(new."Maas"+new."Yol"+new."SSK"+new."Yemek");
update "Ucret" set "ToplamUcret"=toplam where "UcretNo"=new."UcretNo";
end if;
return new;
End;
$function$
```

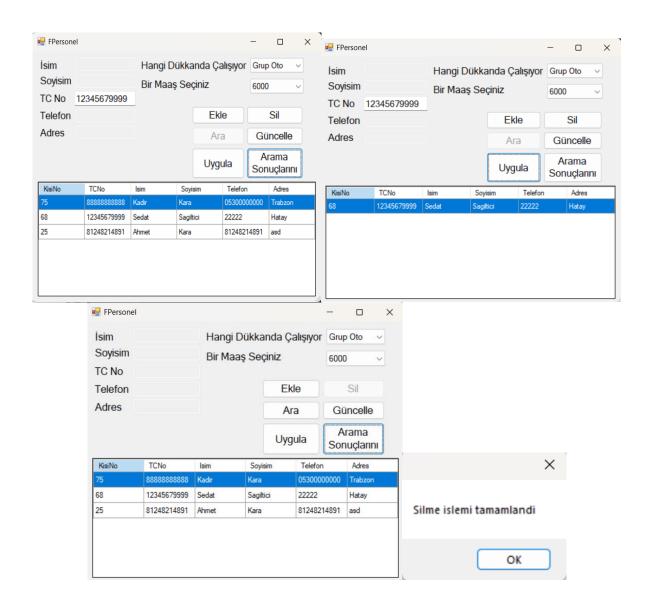

• tamirsilinince() bir trigger fonksiyondur. Tamir silinince tamir-personel tablosundaki ilişkili verileride siliyor.

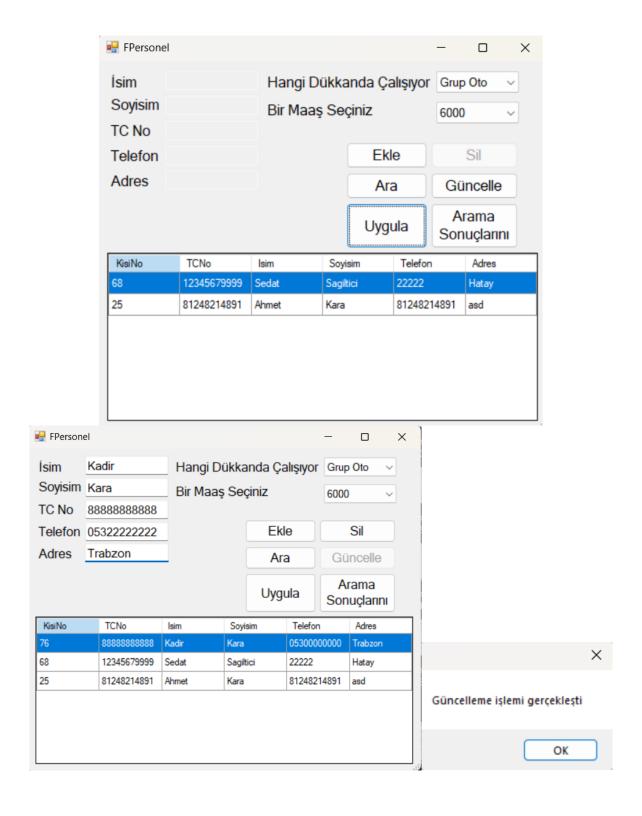

```
CREATE OR REPLACE FUNCTION public.tamirsilinince()
RETURNS trigger
LANGUAGE plpgsql
AS $function$
declare
begin

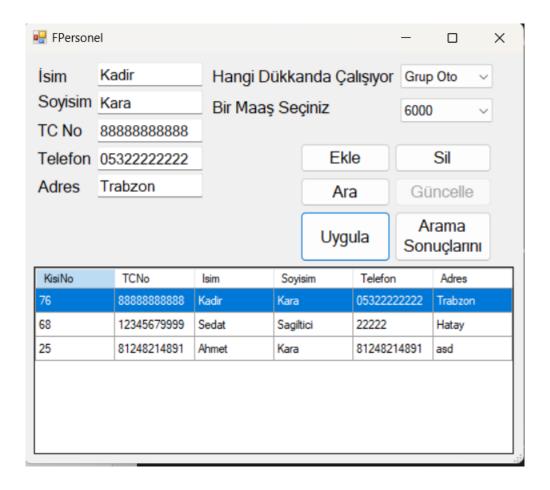

delete from "Tamir-Personel" where "Tamir-Personel"."GelirNo"=new."GelirNo";
return new;
end;
$function$
```
